## SidStation\'s \"auto reset\"...

Posted by ural - 2008/01/19 07:27

---

hi!

have somebody ever experienced "auto reset" of sidstation? time to time i got my sid memory completely empty when i turn it on...

i'm using sid paired with mnm trough midi.  
perhaps it is a wrong midi message what sid got form mnm that erase all stuff?

or is there any sid internal battery what might be almost empty now?

any ideas?

u

Hellou!

I had a similar problem when i used a RM1x as sequenser, it sended out all kinds of midimessanges and it fucked upp all the patchmemory, i had to erase all memory to get in to the patch meny..... like 4years of good and unbacked-up patches flew away!!

I have not experienced it with any other sequenser, mail elektron and ask if they know what it might be...

i saw something similar before... if the sid gets a program change message greater than the number of patches it can store, it will go into some weird memory space and start deleting/reseting its memory (and eventually restart too). program change messages as standard can go up to 127 but sid only has 99 (or 100, i forget). so there's definitely a danger of this and perhaps this is what you did.
