
Clicks and pops on volume p-lock MDUW

Posted by RawTech - 2013/05/18 22:55

Hi, I recently got an MDUW and love it. I sequenced some drums and wanted to place some ghost notes. So I did some p-lock automations on the volume knob in the routing page.

The desired effect is achieved but get clicks and pops at the start of the notes. It mainly occurs when the previous note decay value reaches the note after. Any hints on how to get rid of this ?

Without the volume p-locks there are no clicks.

You can try plock changing the envelope so that the two notes don't run together. You can also see about plocking the attack or LFOing the filter. Keep at it and you may be able to find something that is workable. Worst case scenario, copy the drum sound to another track and put the ghost notes on a separate track. Then they won't get cut off by the main sound. Good luck and enjoy your new MD.
