
Vulnerability of PSU inputs on elektron units

Posted by bonde - 2013/09/10 18:16

Hey all,
I posted this over at Elektronauts as well.

Every time i plug the PSU into my MD, I can't stop thinking that the input seems kinda weak/vulnerable.
The "head" of the PSU seems not to be firmly in place when it's plugged into the MD, as it moves easily about 2 millimeters from side to side. Is this normal?

It doesn't fall out, though.

But I become more and more paranoid, thinking that one day I will break the unit by not being careful enough when plugging in the PSU.

So I was wondering if any of you have the same experience? Or just any thoughts about this.

Peace

=====
